Mean 39.883; Variance 187.451; scale 0.213

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Measurement of age-1 gene expression or AGE-1 protein activity can be used in the determination of the longevity of an animal. Sequence 1146 AA;	Since the agents target invertebrate diapause events, they are safer pesticides than compounds that inhibit neuro-transmission.	longevity (delay the onset of age-related conditions) in a mammal. They can be used as pesticides (against insects and nematodes).	that decrease expression or activity are used to increase	of senescence. Reduced AGE-1 mediated signalling increases longevity while complete abrogation causes developmental arrest. Agents	phosphatidylinositol-3-kinase (PI3K) involved in control	Claim 1; Fig 6; 54pp; English. The sequence is that of the AGE-1 polypeptide. AGE-1 is a	to identify modulators, potentially useful for increasing longevity	cells - and antibodies, used to determine longevity of animals and	PGF-1 TO1014.	WPI; 98-145603/13. from a CDNA library constructed from man cDNA isolated coll line KGla. Positive clones were sequenced from the human CC roll line KGla. Positive clones were sequenced to give a human CC library constructed from man isolated from the human CC pi3 kinase pl10 sequence. This sequence has 95 percent collops with the bovine sequence. The domain encoding residues 19-cc library collection to encode the kinase which will collected a protein with pi3 kinase subunit. The gene may be used to collected protein with pi3 kinase activity, and is useful for cuseful for (ant)agonists of pi3 kinase activity which could be cuseful for stimulation or inhibition of cell proliferation and hence corpopylaxis or therapy. Platelet or neutrophil activity or blood collected salso R4342 and R46552-3.

Sequence 1068 AA.

                                                                                                                                                                                                                                                                                                          a fragment of a PI3-kinase-encoding sequence and human cDNA isolated from a cDNA library constructed from mRNA isolated from the human cell line KGla. Positive clones were sequenced to give the human PI3 kinase pi10 sequence. This sequence has 95 percent homology with the bovine sequence. The domain conty. residues 19-100 of human pi10 is sufficient to associate with the p85 kinase subunit. The protein with PI3 kinase activity is useful for screening for (ant)agonists of PI3 kinase activity which could be useful for stimulation or inhibition of cell proliferation and hence prophylaxis or therapy. Platelet or neutrophil activity or blood allocate in the passociate with proliferation and hence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             R43342;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1084

     Nucleic acid encoding regulatory (p101) and catalytic (p120) subunits of a heterodimeric phosphatidylinositol-3' kinase in treatment and diagnosis of immune system disorders, e.g. arthritis, cancer and Alzheimer's disease Example IX; Fig 4; 75pp; English.

This sequence represents a novel catalytic subunit, p120, frophosphoinositide 3-hydroxykinase (PI3K) which is regulated by subunits of trimeric G-protein. Nucleic acid coding for p101 their fragments, are used as probes and primers for identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sus scroft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Porcine G-protein regulated PI3K p120 adapter subunit protein. Phosphoinositide 3-hydroxykinase; PI3K; trimeric G protein; porcine adapter subunit; regulatory subunit; p101; p120; catalytic subunit; detection; diagnosis; activation disorder; haematopoietic system; treatment; immune disorder; inflammation; arthritis; septic shock; adult respiratory distress syndrome; pneumonia; asthma; allergy; reperfusion injury; atherosclerosis; Alzheimer's disease; cancer.

                                                                                                                                                                                Ş
                                                                                                                                                                                                                        В
                                                                                                                                                                                                                                                                                                                                    Crisis is the deduced mino acid sequence of the pl20 catalytic fils is the deduced mino acid sequence of the pl20 catalytic subunit of pig G-protein regulated phosphatidylinositol-3' kinase (PI3K), a heterodimeric enzyme which produces the intracellular messenger phosphatidylinositol (3,4,5)-triphosphatidylinositol (3,4,5)-triphosphatidylinositol cativation of trimeric G protein-linked receptors. This novel protein, which also contains a regulatory subunit, pl01 (see W23946), is found in cells of haematopoietic origin and is involved in immune system responses which cause inflammation. pl01 cDNA (see W23946), is found in cells of haematopoietic origin and is involved in immune system responses which cause inflammation. pl01 cDNA (see W23946), was obtained from a neutrophil cDNA library. The invention cencompasses pig and human pl01 and pl20 proteides (see W23946-49), host cell expression systems, pl01 and pl20 proteides (see W23946-49), constituted and transgenic and knockout animals. Compounds which are useful for treating inflammatory response disorders can be identified by screening assays using a G protein activated Pl3K, or a cultured host cell that expresses the pl01 gene. Antagonists of capacially by disrupting the interaction between the pl01 and pl20 subunits) can be used to treat arthritis, septic shock, adult resperfusion injury, atherosclerosis, cancer and Alzheimer's disease. The nucleic acids and their products can also be used for diagnosis, disease.
                                                                                                                                                                                                                                                           Best Loc

This is the deduced amino acid sequence of the catalytic p110 (delta subunit of human phosphatidylinostic) 3-kinase (PT 3-kinase). The sequence was deduced from a composite cDNA clone (see V58570) (closed from peripheral blood mononuclear cell and macrophage cDNA. The following are claimed: (1) a purified and isolated polynucleotide (PN) encoding p110 delta; (2) a vector comprising a CDNA as in (1); (3) a host cell stably transformed or transfected with a DNA as in (1); (4) PN encoding a lipid kinase, and hybridising to PN having the 5220 bp sequence; (5) a purified and isolated p110 delta polypeptide as in (4); (6) an antibody as in (6); and (8) a humanised antibody as in (6). p110 delta has kinase activity and may play a role in PI 3-kinase mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1128

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 15; Fig 13; 75pp; English.

This sequence represents a novel catalytic subunit, pl20, from human phosphoinositide 3-hydroxykinase (PIJK) which is regulated by beta-gamma subunits of trimeric G-protein. Nucleic acid coding for pl01 or pl20, or their fragments, are used as probes and primers for identifying pl01 or pl20 gene mutations, allelic variations or regulatory defects, particularly for the diagnosis of activation disorders (or susceptibility) in cells of the haematopoletic system. The related proteins, antibodies, agonists and antagonists can be used similarly. The pl01 and pl10 proteins, peptides or fusion proteins are used to treat or screen for potential agents for treating immune disorders, particularly inflammation, e.g. arthritis, septic shock, adult respiratory distress syndrome, pneumonia, asthma, allergies, reperfusion injury, atherosclerosis, Alzheimer's disease and cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                PT Auto-phosphorylating peptide with phosphatidyl:inositol
PT 3-kinase-like activity, designated pl10delta - useful for
Controlling cell motility, particularly of metastatic cancer cells
PS Disclosure; Fig 1h; 72pp; English.
CC The present sequence represents a novel autophosphorylating protein
CC that has PI3 (phosphatidylinositol 3-hydroxy) kinase activity, and
CC is designated pl10-delta. The protein is expressed selectively in
CC white blood cells and melanomas. The protein is a lipid kinase with
CC broad phosphoinositide specificity and specific tissue localisation,
CC possibly involved in regulation of melanoma metastases (it is not
CC expressed in normal melanocytes). DNA fragments encoding the present
CC expressed in normal melanocytes). DNA fragments encoding the present
CC similar analysis can be done at the protein level using antibodies in
CC standard immunoassays. These assays are particularly used for diagnosing
CC and predicting motility/invasiveness of metastatic cancer cells. The
CC protein can be used in human or veterinary medicine for controlling
CC motility of cells, where the protein increases motility while antisense
                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-JUN-1996; GB-01146U.

DNA encoding G-beta-gamma regulated phosphatidyl-inositol-3' kinase, pl01 and p120 subunits - useful for diagnosis, drug screening, clinical trial monitoring and treatment of inflammatory disorders Claim 55; Fig 11; 151pp; English. This is the deduced amino acid sequence of the p120 catalytic subunit of human G-protein regulated phosphatidylinositol-3' kinase (P13K), a heterodimeric enzyme which produces the intracellular

Antagonists of G protein stimulated P13K (acting through the p101 subunit, especially by disrupting the interaction between the p101 and p120 subunits) can be used to treat arthritis, septic shock, adult respiratory distress syndrome (ARDS), pneumonia, asthma, allergies, reperfusion injury, atherosclerosis, cancer and Alzheimer's disease. The nucleic acids and their products can also be used for diagnosis, disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               messenger phosphatidylinositol (3,4,5)-triphosphate in response to activation of trimeric G protein-linked receptors. This novel protein, which also contains a regulatory subunit, pl01 (see W23949), is found in cells of haematopoietic origin and is involved in immune system responses which cause inflammation. Human pl20 rnna was obtained from a leukocyte cDNA library. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cDNA was obtained from a leukocyte cDNA library. The invention encompasses pig and human pl01 and pl20 uncleotides (see V04633-34), host cell expression systems, pl01 and pl20 proteins (see W23946-49) fusion proteins, polypeptides and peptides, antibodies to these proteins, and transgenic and knockout animals. CC A 402 bp cDNA fragment was amplified from a human bone marrow CC library using PCR primers corresponding to amino acid sequences CC KNGDDLR and HIDFG. The amplified fragment was used to probe a human CC U937 cell cDNA library and several overlapping clones were isolated. CC The largest clone had a sequence coding for a protein having the CC phosphatidylinositol 3-kinase (PI3K) that differs in its regulatory CC mechanism from the known PI3K-alpha and beta enzymes. The new enzyme CC has been designated PI3K-gamma and can be used as an immunogen. The CC constanting cell proliferation, receptor-mediated signal CC transmission, histamine secretion, nerve cell differentiation, glucose constants of the constant of the

                                                                           then isolated. The enzyme can be used as an immunogen. The enzyme antibodies against it or nucleic acid encoding it can be used for modulating cell proliferation, receptor-mediated signal transmission, histamine secretion, nerve cell differentiation, glucose transport and anti-lipolytic activity or for treating
                                                                                                                                                             library using PCR primers corresponding to amino acid sequences KNGDDLR and HIDFG. The amplified fragment was used to probe a human U937 cell cDNA library and several overlapping clones were isolated. The largest clone coded for a protein of 1049 residues. The protein is a novel phosphatidylinositol 3-kinase (PI3K) that differs in its regulatory mechanism from the known PI3K-alpha and beta enzymes. The new enzyme has been designated PI3K-gamma. Another clone, coding for a PI3K-gamma having the present sequence of 1050 residues, was the resulted which the present sequence of 1050 residues, was the resulted which the present sequence of 1050 residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human phosphatidylinositol 3-kinase PI3K-gamma. Phosphatidylinositol 3-kinase; gamma, PI3K; immunogen; immobiliferation; receptor-mediated signal transmission; histamine secretion; nerve cell differentiation; glucose temodulation; regulation; Alzheimer's disease; lipolysis.
                                                                glucose transport and anti-lipolytic Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                         New
                                                                                                                                                                                                                                                                                                                                                                                       (PLAC ) MAX PLANCK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This protein sequence comprises cpk-m, a murine polypeptide that to belongs to a novel class of phosphatidyl inositol 3-kinases that contain a C2 domain, are capable of phosphorylating a D3 hydroxyl of an inositol ring in phosphatidyl inositol and phosphatidyl inositol and phosphatidyl inositol and phosphatidyl inositol and phosphatidyl inositol 4-phosphate, but not in phosphatidyl inositol (4,5-bisphosphate, and which are involved in cell signalling cascades that control e.g. cell cycle progression and intracellular protein sorting. The amino acid sequence was deduced from an isolated cDNA sequence (see T80199). It shows 34% identity and 48% similarity to Drosophila cpk (see W38757). Novel phosphatidyl inositol 3-kinases can be used to screen for agonists/antagonists of activity and in a claimed method of treating a disorder caused by dysregulation of a growth factor activation signalling cascade. Antagonists may reduce Ras activation allowing treatment of proliferative disorders such as atherosclerosis, inflammatory joint disease, psoriasis, restenosis following angioplasty, and cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a human class II phosphoinositide lipid (P13) kinase designated PIM3-CZalpha. It is characterised as a class II kinase due to the presence of a conserved C2 domain found in murine and Drosophila class II P13 kinases, its apparent lack of a p85 binding site and a substrate affinity to inositol lipids PtdIns and PtdIns(4)p. The protein has resistance to p13 kinase inhibitors Wortmannin and LY294002. Antibodies against the protein (optionally humanised), are used to identify class II P13 kinases. Antisense sequences, antibodies or dominant negative mutants of the p13-CZalpha protein, are useful in huma or veterinary medicine to block class II kinases. They can be used to treet tumour cells where the phenotype is associated with expression of p14-CZalpha protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                  belongs to a novel class of phosphatidyl inositol 3 kinases that contain a C2 domain, are capable of phosphorylating a D3 hydroxyl of an inositol ring in phosphatidyl inositol and phosphatidyl inositol and phosphatidyl inositol and phosphatidyl inositol and phosphatidyl inositol classed that control e.g. cell cycle progression and intracellular cascades that control e.g. cell cycle progression and intracellular protein sorting. The amino acid sequence was deduced from an isolated cDNA sequence (see T80200). It shows 34% identity and 48% similarity to mouse cpk-m (see W38756). Novel phosphatidyl classed to 3 kinases can be used to screen for agonists/antagonists of activity and in a claimed method of treating a disorder caused by dysregulation of a growth factor activation signalling cascade. Antagonists may reduce Ras activation allowing treatment of proliferative disorders such as atherosclerosis, inflammatory joint disease, psoriasis, restenosis following angioplasty, and cancer.

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 55.192; Variance 111.319; scale 0.496
